

DEMO 01 · PPBE STORYTELLING & TRACKING

Make the budget tell its own story — and update itself when the world moves.

Program justification narratives, exhibit drafting, and execution tracking that stay synchronized with the underlying data, all the way from POM build through execution year.

Who this is for: OUSW(C) Program/Budget, Service Comptrollers (FM&C), Service Investment & Development directors, PEO/PM financial leads

The problem we hear

- Budget books and justification exhibits become stale the day they're printed — but the questions from OSD, OMB, and the Hill keep coming.
- Re-drafting narratives every cycle pulls senior analysts off higher-value work; version control across exhibits, briefings, and execution reports is manual.
- Leadership cannot trace a dollar from POM through PB through execution without an analyst stitching three systems together by hand.

What changes when you deploy this

Your PPBE narrative becomes a living artifact tied to the underlying program, appropriation, and execution data. When the data shifts, the story shifts with it — with full lineage, version history, and audit trail. Your team spends less time writing and re-writing, and more time defending the program.

The 7-minute demo

1. Start with a real (sanitized) program element — pull its POM, PB, and current execution data into one view.
2. Generate the justification narrative draft from structured data — with the approved tone, formatting, and exhibit structure baked in.
3. Change an assumption (BA shift, congressional mark, schedule slip). Watch the narrative, exhibits, and execution forecast update with full change-tracking.
4. Drill from the narrative paragraph back to the source obligation, contract, and program milestone.
5. Export to the exhibit format your team submits today.

You will see, live

- Side-by-side narrative versions with change-tracking and the analyst who made each edit.
- Live link from a justification paragraph to the underlying obligation row.
- Auto-generated rollups by appropriation, BA, BLI, and program element.
- Execution-to-plan variance flagged at the line of accounting.
- Audit-ready lineage: data source → transformation → narrative output.

Why this is different

- **Built on your data, not ours.** We deploy into your environment, against your authoritative sources — no data migration, no shadow system.
- **Narrative-first, not dashboard-first.** Most tools give you another dashboard. Your team writes narratives. We accelerate the writing.
- **Designed around the PPBE calendar.** POM lock, PB submission, congressional marks, reprogramming — the tool knows what month it is.

Acquisition path

GSA MAS · DLA SOE · OTA (prototype/production)

First 30 days: scoped pilot on your existing data, sanitized environment, no PII/CUI movement off your network. Outcome on day 30: a working capability demonstration tied to a named program-of-record problem.

Next step: a 30-minute follow-up call

After the conference, we'll walk through your specific data and stand up the pilot scope. Scan to pick a time, or email [\[primary@domanigroup.com\]](mailto:primary@domanigroup.com).

At the conference: visit Suite [###] for the live demo. Walk-ins welcome; pre-booked 30-minute slots get priority.
