

## DEMO 02 · CIVILIAN PAY ANALYSIS &amp; FORECASTING

# Know what civilian payroll will cost you — before the end-of-year scramble.

*Variance attribution and forward-looking burn projection for civilian pay, by appropriation and organization, sourced directly from DCPS / DCAS / DFAS feeds.*

**Who this is for:** DFAS leadership, Service Financial Operations DASNs, command-level resource managers, manpower/comptroller integration leads

## The problem we hear

- Civilian pay forecasts drift through the year. By Q4, leadership is reconciling surprise overages or hunting unobligated balances under deadline pressure.
- Variance is reported in aggregate — not attributable to *which* position, *which* action, or *which* assumption changed.
- Audit findings on payroll continue to repeat because the linkage between manpower authorizations, on-board strength, and disbursed pay isn't transparent end-to-end.

## What changes when you deploy this

Civilian payroll becomes predictable. You see the year-end position by appropriation in near-real time, with variance attributed to specific drivers — hiring lag, step increases, awards, benefits, locality — not a black-box delta. End-of-year surprises shrink. Audit posture improves.

## The 7-minute demo

1. Load a sanitized command-level civilian pay dataset (DCPS feed + manpower authorizations + obligation data).
2. Reconcile authorized vs. on-board vs. obligated vs. disbursed at the line of accounting.
3. Run a 6-month forward forecast with attribution: what is driving the variance, down to position type and pay element.
4. Stress-test a scenario (hiring freeze, locality change, RIF). See the dollar impact by appropriation and fiscal quarter.
5. Generate an audit-ready exception report on reconciliation breaks.

## You will see, live

- Year-end civilian pay landing zone, by appropriation, with confidence range.
- Variance waterfall: plan → actual, with named drivers.
- Hiring-lag impact on burn rate, modeled forward.
- Reconciliation exceptions between manpower, payroll, and obligation systems.
- Drill-down to the position and pay period.

## Why this is different

- **Pulls from your authoritative pay and manpower systems.** No re-keying, no spreadsheet snapshots, no “data lake project” precondition.
- **Attribution, not aggregation.** Variance is explained by driver, not just displayed as a number.
- **Built for the audit conversation.** Every figure has lineage back to the source-of-record transaction.

## Acquisition path

**GSA MAS · DLA SOE · OTA** (prototype/production)

**First 30 days:** scoped pilot on your existing data, sanitized environment, no PII/CUI movement off your network. Outcome on day 30: a working capability demonstration tied to a named program-of-record problem.

**Next step: a 30-minute follow-up call**

After the conference, we'll walk through your specific data and stand up the pilot scope. Scan to pick a time, or email **[primary@domanigroup.com]**.

**At the conference:** visit Suite [###] for the live demo. Walk-ins welcome; pre-booked 30-minute slots get priority.
