

DEMO 03 &MIDDOT; ADVANA-BASED STATUS OF FUNDS

A Status of Funds that's current when leadership opens it — not when the analyst sent it.

Status of Funds reporting and integration built on Advana, with drill-down from appropriation to commitment, obligation, and expenditure — and exception triggers that route to the right action officer.

Who this is for: OUSW(C) DCFO and Performance Dashboards team, Service Comptroller offices, command-level financial operations, FIAR leads

The problem we hear

- Status of Funds reports are stale by the time they hit the comptroller's desk. Decisions get made on last week's picture.
- Each command and program assembles its own SoF view — methodologies vary, rollups don't reconcile, and OSD asks the same question five times.
- Exceptions (negative balances, unliquidated obligations, ULOs aging out) are found in monthly reviews, not when they happen.

What changes when you deploy this

Your Status of Funds is live, sourced from Advana, and consistent across every level of the chain. Exception triggers fire when something needs attention — routed to the named action officer, with the supporting data already attached. The monthly fire drill becomes a monthly review of what was already handled.

The 7-minute demo

1. Open a live SoF view sourced from Advana, scoped to a representative command or program.
2. Drill from appropriation → BA → BLI → line of accounting → individual obligation document.
3. Trip an exception threshold (e.g., obligation rate behind plan, ULO aging past policy). See the trigger fire and the routing logic select the right action officer.
4. Review the auto-generated exception packet: the data, the policy citation, the suggested action, the audit trail.
5. Roll the view up to OSD-ready format and compare to last cycle.

You will see, live

- Live SoF with last-update timestamp measured in hours, not weeks.
- Consistent rollup methodology across appropriations and commands.
- Exception triggers with named owners and SLAs.
- Audit-ready data lineage from Advana source tables to the SoF line item.
- Direct mapping to the OUSW(C) self-correcting controls model.

Why this is different

- **Advana-native.** We meet you where your data already lives. No parallel data pipeline, no “rip and replace.”
- **Self-correcting controls aligned.** The exception-trigger model mirrors the OUSW(C) direction on feedback-driven controls — not a competing framework.
- **Action-routed, not just visualized.** An exception with no owner is a dashboard. An exception routed to an owner with a deadline is a control.

Acquisition path

GSA MAS · DLA SOE · OTA (prototype/production)

First 30 days: scoped pilot on your existing data, sanitized environment, no PII/CUI movement off your network. Outcome on day 30: a working capability demonstration tied to a named program-of-record problem.

Next step: a 30-minute follow-up call

After the conference, we'll walk through your specific data and stand up the pilot scope. Scan to pick a time, or email [\[primary@domanigroup.com\]](mailto:primary@domanigroup.com).

At the conference: visit Suite [###] for the live demo. Walk-ins welcome; pre-booked 30-minute slots get priority.
